

Beginning Python Exercises

1. Ask the user for a temperature in Celsius and convert it to Fahrenheit.

```
Temperature in °C: 32
Celsius: 32.0 => Fahrenheit: 89.6
```

2. Ask the user for a name, an adjective, a verb (past tense) and a place. Print a silly sentence using them.

```
Name: Jason
Adjective: suspicious
Verb (past tense): Crawled
Place: Tim Hortons
Jason Crawled to the Tim Hortons with a suspicious grin.
```

3. Ask the user for the width and height of a rectangle. There could be decimals. Calculate and display the width, height, area, and perimeter. Calculations print the results rounded to 3 decimal places.

```
Rectangle width: 100.2
Rectangle height: 241.3
Width: 100.2
Height: 241.3
Area: 24178.260
Perimeter: 683.000
```

4. Ask for the price of an item and the quantity purchased. Display the amount of the total including GST.

```
Enter the price: 50
Enter the quantity: 2
Purchasing 2 of this item worth $50.00 including the GST amount of $5.00 is $105.00
```

5. Ask the user for a number of miles and print out how many kilometres it is. Display to 2 decimal places.

The conversion rate is 1 mile = 1.609344 kilometers

```
Enter the number of miles: 400
400.0 miles is 643.74 kilometers
```

6. Ask the user for the distance they want to travel, the fuel consumption of their vehicle in l/100km and the price per litre. Display the cost for

```
Enter distance in km: 105
Enter fuel consumption (liters per 100 km): 8.4
Enter price per liter: 1.05
Fuel needed: 8.82 liters
Total cost: $9.26
```

the trip!
